

I could only get quicksort and bubble sort to work, but they do not work with strings.

I had a hard time with this assignment, mostly because I was stuck in an object oriented mindset. I had well over 100 compile errors and fewer runtime errors.

I did not achieve polymorphism because I could not get namespaces to work.

My sorting algorithms only work in one direction.

I did have a lot less code than java or scala. I had less than 100 lines.

I also found that clojure worked a lot faster than scala or java.

Overall, I could see the potential of clojure, but I didn't feel that I knew enough about the language to effectively use it.
